Trouble-shooting program

Rapid diagnosis chart for L-Jetronic universal adapter

The following rapid diagnosis chart makes it possible for the experienced L-Jetronic expert to quickly check the electrical part of the system using the L-Jetronic universal adapter.

The rapid diagnosis chart contains the following information:

- Switch positions on universal adapter
- Sequence of test steps
- Notes on how to operate the universal adapter or other components
- Readings on the multimeter
- References to coordinates of the relevant detailed testing and trouble-shooting program.

If detailed information and instructions are necessary, always proceed according to the trouble-shooting program starting on Coordinate B 1/B 2.

Rapid diagnosis chart for L-Jetronic universal adapter

Test step	Switch position		Remarks	Test specifications (reading)	See Coordinate for trouble-shooting
	V	Ω			
1	5	-	Shift gear to neutral. Operate starting motor. Measure voltage pulses with motortester.	Ignition pulses on motortester (greater than 80 V)	B 10

Test lead

Using the test lead, the injection pulses at the injection valves can be tested with an ignition oscilloscope with the engine running.

The illustration shows the injection pulse of a switched output stage, measured at the solenoid-operated injection valve.

Caution:

Connect only one terminal of the test lead to the special input on the motortester. When the correct test terminal is connected, the above-shown voltage curve will be visible on the injection oscilloscope.

Instructions on use of universal adapter with adapter lead for LE-Jetronic

General:

The universal adapter is plugged onto the vehicle wiring harness with the adapter lead.

Caution:

Connect and disconnect the universal adapter only with the ignition switched off!

Testing:

For testing, connect a multimeter with R_i min. $20\text{ k}\Omega/\text{V}$ to the test adapter.

In addition, the signal from term. 1 of the ignition coil can be measured with a motortester via the special input.

Control unit

The control unit is located in the passenger compartment on the front passenger side in the footwell at the bottom right.

Pressure regulator:	underneath intake manifold center right
Fuel-line-pressure damper:	underneath vehicle, on right- hand side behind rear wheel
Fuel filter:	underneath vehicle, on right- hand side in front of rear wheel
Fuel pump:	underneath vehicle, on right- hand side behind rear wheel
Pump fuse:	in fuse box, driver's side, underneath instrument panel on left-hand side
Temperature sensor II:	in cooling water circuit at front on engine block
Central ground:	on intake manifold on right- hand side near firewall
Vacuum limiter: (only on Sweden version)	near throttle-valve assembly

Important general information

1. Never start engine without securely connected battery.
2. Do not use a starting aid with more than 16 V or a fast charger for starting.
3. Never disconnect battery from vehicle electrical system with engine running.
4. Disconnect battery from vehicle electrical system when fast charging.
5. Remove control unit at temperatures above 80°C (paint drying installation).
6. Ensure that all connectors of wiring harness are properly attached.
7. Never connect or disconnect wiring-harness plug of control unit with ignition switched on.
8. When testing compression, cut the power supply by removing the control relay. This ensures that the voltage supply for the LE-Jetronic and therefore also the injection valves is interrupted. Undesired injecting is thus prevented.
9. Remove the LE-Jetronic control unit before carrying out electric welding work (e.g. spot welding).
10. When using the following trouble-shooting program it is assumed that the engine is in proper working order and that the ignition is correctly set. The electrical system must be checked and, if necessary, repaired.

In order to carry out the testing operations described in this manual and in order to assess the components, you should be familiar with the L-Jetronic and how it works. The essential points regarding the operation and construction of the L-Jetronic are described in Technical Instruction VDT-U3/3.

Trouble-shooting

The following trouble-shooting programs are designed to enable workshop employees, using the universal adapter with adapter lead (1 684 463 123) and other suitable test equipment, to quickly locate causes of trouble on the L-Jetronic. Depending on the level of knowledge and experience of the mechanic, a choice can be made between the following procedures:

- detailed step-by-step trouble-shooting for employees with little experience or practice on LE-Jetronic vehicles
- pin-pointed direct trouble-shooting for trained, experienced employees who have had a great deal of practice on LE-Jetronic vehicles

B3**B5**

Both trouble-shooting programs begin by checking the electrical part of the LE-Jetronic with the aid of the universal adapter with adapter lead. In this way, the wiring harness with the connected components is soon checked for proper electrical operation and faults are quickly located. If no fault is found using the universal adapter with adapter lead, continue trouble-shooting with the detailed or the direct trouble-shooting program.

B1

Trouble-shooting

Opel Manta, Rekord 2.0 1

**B2**

Trouble-shooting

Opel Manta, Rekord 2.0 1

1. Detailed step-by-step trouble-shooting

1.1 Test with universal adapter with adapter lead 1 684 463 123

This test must come at the beginning of the test program and must be performed from beginning to end (Coordinates B 9 - C 7).

1.2 Trouble-shooting according to customer complaints (symptoms of trouble)

The table below contains possible symptoms of trouble and gives the first coordinate of the relevant detailed trouble-shooting program in the column on the right.

The trouble-shooting program consists of logically ordered test procedures for all individual components of the LE-Jetronic. If, after completing the trouble-shooting program for an assumed trouble, the fault has not been detected or remedied, take a new symptom of the trouble and work through another program.

<u>Customer complaint (symptom of trouble)</u>	<u>Universal adapter</u>	<u>Coordinate</u>
1. Engine fails to start or starts only with great difficulty	B 9	C 8
2. Engine starts but then dies	B 9	D 11
3. Uneven engine idle	B 9	E 7
4. Poor throttle take-up	B 9	F 13
5. Engine misses under all operating conditions	B 9	G 3
6. Fuel consumption too high	B 9	G 19
7. No maximum engine power	B 9	H 17
8. CO concentration at idle too high or too low	B 9	J 13

B3

Trouble-shooting

Opel Manta, Rekord 2.0 1

**B4**

Trouble-shooting

Opel Manta, Rekord 2.0 1

2. Pin-pointed direct trouble-shooting

2.1 Test with universal adapter with adapter lead 1 684 463 123

The test with the universal adapter must come at the beginning of the test program and must be performed from beginning to end (see Coordinates B 9 - C 7).

2.2 Trouble-shooting according to customer complaints

The table below contains various symptoms of trouble with several possible causes of the trouble in each case. The Coordinate reference field indicates the first coordinate of the test procedure for the respective LE-Jetronic components. If, after testing the individual components, the fault has not been detected or remedied, choose a new symptom of the trouble.

Customer complaint (symptom of trouble)

1. Engine fails to start or starts only with great difficulty								
2. Engine starts but then dies								
3. Uneven engine idle, idle speed incorrect								
4. Poor throttle take-up								
5. Engine missing under all operating conditions								
6. Fuel consumption too high								
7. No maximum engine power								
8. CO concentration at idle too high or too low								
<u>Cause</u> (component fault)								
B 9	B 9	B 9	B 9	B 9	B 9	B 9	B 9	Universal adapter
C10				G 5				Control relay defective
C10								Electric fuel pump not operating

Test chart for universal adapter with adapter lead
connected - LE-Jetronic

Test chart for Opel Rekord and Manta as of 10.81

Carefully plug the universal adapter onto the vehicle wiring harness (ignition must be off).

The universal adapter is used for testing the peripherals only. In order to obtain the measured values, connect to the universal adapter e.g. a multimeter for voltage and resistance measurements as well as a motortester.

The individual test steps are selected by means of two program switches (one for voltage measurements, the other for resistance measurements). Each program switch has 24 test positions, only some of which are occupied for the LE-Jetronic.

Be sure to observe the instructions given in the test chart!

In test steps 1-3, voltages are measured while starting.
Caution: Set the multimeter to "voltage measuring range"

In test steps 4-10, resistances are measured.
Caution: Set the multimeter to "resistance measuring range".

Test specifications and operator information for the universal adapter are given in the following test chart. The control unit is located in the passenger compartment on the front passenger side in the footwell at the bottom right. It is fastened in position by three screws.

Note:

In the following test steps a white surround in the "Operation" column indicates which operation is different from the preceding test step.

Opel Manta, Rekord 2.0 I

Test step: 7 Operation		Reading	Testing
Program switch position "V":	↓	Multimeter must indicate 0 ...10 Ω	Component: Ground connection of output stage
Program switch position "Ω":	14		
Measuring equipment: Multimeter (Ω range)			Operation: Ground connection of control unit
Measuring range: x 1 Ω			Malfunction: Resistance outside tolerance
Connection: Test sockets blue			
Operation in vehicle:		Trouble-shooting: For testing, remove the wiring-harness plug from the test adapter and use the circuit diagram if necessary.	

Test the following leads for continuity using ohmmeter (set value approx. 0 Ω):
 From multiple plug term. 13 to output stage ground terminal.
 From multiple plug term. 5 to electronics ground terminal.

Eliminate contact resistances at the plug-in connections.

Kl. = Terminal

Top view of multiple plug

Installation position of components:

1. Output stage ground terminal
 On intake manifold on right-hand side near firewall

Test step: 8			
Operation		Reading	Testing
Program switch position "V"	↓	Multimeter must indicate 0 ... 10 Ω	Component: Throttle-valve switch (idle contact)
Program switch position "Ω":	16		
Measuring equipment: Multimeter (Ω range)			Operation: Resistance between throttle- valve switch term. 2 and term.9
Measuring range: x 1 Ω			Malfunction: Resistance outside tolerance
Connection: Test sockets blue			
Operation in vehicle: Accelerator in rest position		Trouble-shooting: For testing, remove the wiring-harness plug from the test adapter and use the circuit diagram if necessary.	

Top view of multiple plug

Adjusting the throttle-valve switch (on intake manifold on right-hand side):
 Slightly loosen the fastening screws of the throttle-valve switch. Connect ohmmeter to throttle-valve switch between term. 2 and term. 9. Turn throttle-valve switch in an anti-clockwise direction until idle contact (microswitch) is heard to click. (Reading 0 Ω).
 Checking the adjustment:
 Pull on the throttle cable slightly. The idle contact (microswitch) must be heard to click. (Reading ∞ Ω)

Test the following leads for continuity using ohmmeter (set value approx. 0 Ω):
 From multiple plug term. 2 to throttle-valve switch term. 2
 From throttle-valve switch term. 9 to multiple plug term. 9

Eliminate contact resistances in the plug-in connections.

Test the following leads for continuity using ohmmeter (set value approx. 0 Ω):

From multiple plug term. 3 to throttle-valve switch term. 3

From throttle-valve switch term. 9 to multiple plug term. 9

Eliminate contact resistances in the plug-in connections.

Installation position of components:

1. Throttle-valve switch

On intake manifold on right-hand
side

C3

Test chart for universal adapter
Opel Manta, Rekord 2.0 1

C4

Test chart for universal adapter
Opel Manta, Rekord 2.0 1

Test step: 10			
Operation		Reading	Testing
Program switch position "V":		Multimeter indication + 20°C: 6.75 ... 9.0 Ω	Component: Solenoid-operated injection valve
Program switch position "Ω":	19	+ 80°C: 7.10 ... 9.35 Ω	Operation: Resistance of all solenoid-operated injection valves (in parallel)
Measuring equipment: Multimeter (Ω range)			Malfunction: Resistance outside tolerance
Measuring range Small setting			
Connection Test sockets in blue			
Operation in vehicle		Trouble-shooting: For testing, remove the wiring-harness plug from the test adapter and use the circuit diagram if necessary.	

If reading too high: open circuit in valve coil or valve connector has dropped off.
Check seat of locking lugs.

Test the following leads for continuity using ohmmeter (set value approx. 0 Ω):

From multiple plug term. 12 to the solenoid-operated injection valves.

From the solenoid-operated injection valves to control relay term. 87.

From the solenoid-operated injection valves to multiple plug term. 9.

Resistance measurement at solenoid-operated injection valve:

Ambient temperature (+15°C...+30°C): 15...17.5 Ω

With engine at operating temperature (approx.+80°C): 17...20 Ω

Installation position of components:

1. Injection valves:
2. Control relay:

On intake manifold on left-hand side
In engine compartment on right-hand side near firewall.

C6

Test chart for universal adapter
Opel Manta, Rekord 2.0 1

Testing with the universal adapter is now completed.
If the fault has not been found or if you require
further information and instructions on how to remedy
the fault, continue with the trouble-shooting program of
your choice.

Detailed trouble-shooting → see B 3

Direct trouble-shooting → see B 5

Trouble-shooting program according to customer complaints

How to use the following trouble-shooting program

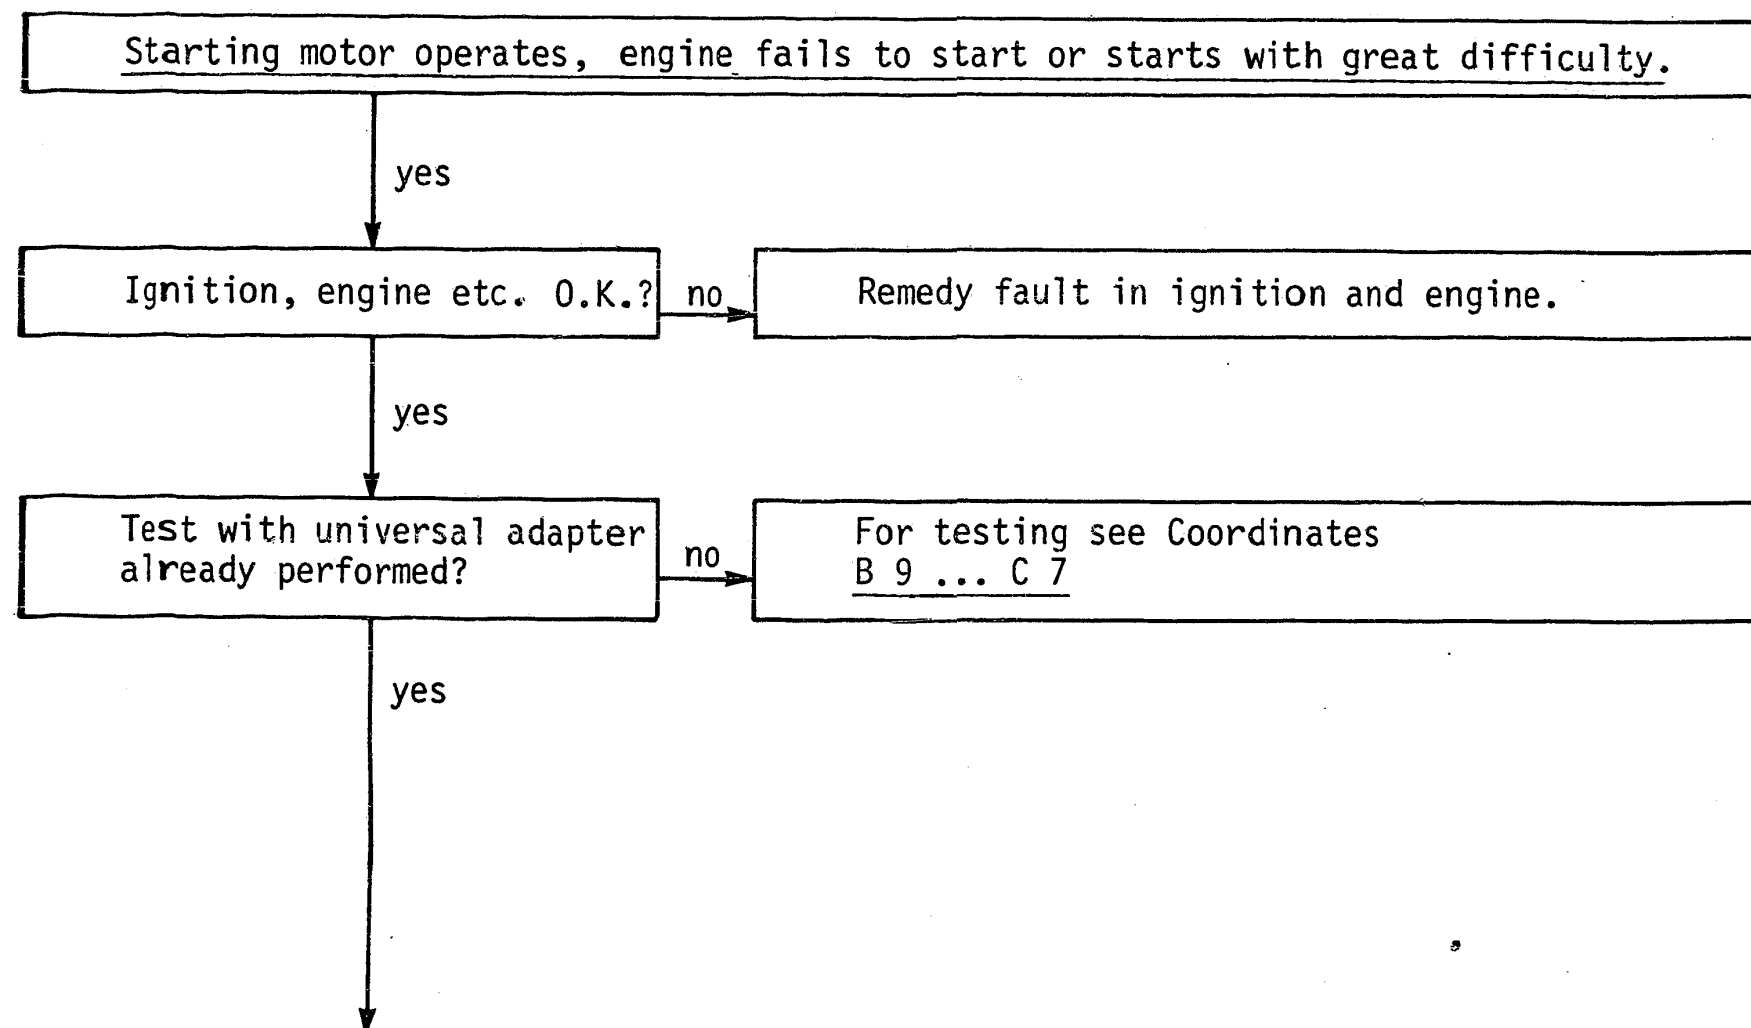

The program is divided into 3 rows of boxes:

1. The left-hand row contains the questions on the tests.
2. The middle row contains descriptions of the testing and adjustment operations on the components.
3. The right-hand row contains the illustrations belonging to the text and explains the illustrations.

If the questions can be answered conclusively with "yes" without testing, proceed to the next question below.

If, on the other hand, the answer to the question is "no", and you suspect a fault, branch to the middle row of boxes and carry out the tests given there.

When you have finished testing continue trouble-shooting at the point at which you branched off.

C8

Engine fails to start
Opel Manta, Rekord 2.0 1

C9

Engine fails to start
Opel Manta, Rekord 2.0 1

Starting motor operates, engine fails to start or starts only with great difficulty

Fuel pump operating?
(listen)
Control relay O.K.?

no

1. Testing the control relay

For testing, unscrew the control relay and turn round so that the connection base is accessible from below. Control relay and connection base remain plugged together. Check the power supply. Switch on the ignition. Using voltmeter, measure battery voltage at term. 30, term. 15 and term. 50 (starting motor) to vehicle ground. Set value: 7...15 V. If no voltage, check connecting cables.

2. Start engine, check voltage at pump fuse (in fuse box; fuel-injection system).

Manta: No. 7 (8A)

Rekord: No. 10 (10A plug-in fuse)

and at control relay term. 87b:

Voltage at term. 87b → replace pump fuse.

No voltage at term. 87b → replace control relay.

3. Ground connection of fuel pump O.K.?

If not → check ground terminal and ground cable for open circuit and proper connection.

Ground terminals:

Manta: Near fuel pump on vehicle body.

Rekord: In luggage compartment between the two wheel boxes behind rear seat panel.

yes

Continued on C12/C13

Starting motor operates, engine fails to start or starts only with great difficulty

Fuel pressure O.K.?

Test specification:

Europe: 2.3...2.7 bar

Sweden: 2.8...3.2 bar

Pressure regulator O.K.?

Test specification reached?

no

Remove the control relay. Fit a jumper into the connection base between term. 87b and term. 30.

Fuel pump must operate

Fuel pump pressure:

Europe: 2.3...2.7 bar

Sweden: 2.8...3.2 bar

Caution!

Remove the jumper and fit the control relay in position. Let the engine idle → fuel pump pressure approx. 2.0 bar or 2.5 bar.

Testing the pressure regulator

Remove the control relay and fit a jumper into the connection base between term. 87b and term. 30. Electric fuel pump must operate.

Fuel pump pressure:

Europe: 2.3...2.7 bar

Sweden: 2.8...3.2 bar

Fuel pressure of 2.3 bar or 2.8 bar not reached:

1. Slowly pinch off fuel return line: (caution: do not load pressure gauge above 6 bar).

Pressure rises above 4 bar → replace pressure regulator.

Pressure remains below 4 bar → replace fuel pump.

yes

C20

Engine fails to start
Opel Manta, Rekord 2.0 1

C21

Engine fails to start
Opel Manta, Rekord 2.0 1

Starting motor operates, engine fails to start or starts only with great difficulty

Start valve O.K.?

no

Functional test:

Check the power supply to the start valve when starting. To do this, remove the plug from the start valve and connect voltmeter to term. 30 and term. 29/term. 4 of the start valve plug.

1. Coolant temperature at ambient temperature (+15°C...+30°C): voltage reading min. 6 V

2. Coolant temperature at engine temperature (approx. +80°C): voltage reading approx. 0 V.

Test the following leads for continuity using ohmmeter. Set value: approx. 0 Ω. Lead from term. 30 to thermo-time switch term. W. Lead from term. 29 to thermo-time switch term. G. Lead from term. 4 to control relay term. 50. Check ground connection of thermo-time switch.

Electrical test of start valve:

Connect ohmmeter to start valve term. 29 and term. 30: set value approx. 4 Ω.

Mechanical test of start valve:

Remove start valve from intake manifold and hold in a container. (Caution! fire hazard!). When starting at temperatures below +30°C the start valve must squirt (max. 8 secs.). At above +40°C the start valve must not squirt. With the ignition switched on and the pressure built up, the start valve must likewise not squirt.

yes

Engine fails to start
Opel Manta, Rekord 2.0 l

C23

Engine fails to start
Opel Manta, Rekord 2.0 l

Starting motor operates, engine fails to start or starts only with great difficulty

Start valve O.K.?
(continued)

no

Carry out squirt test when engine is at operating temperature (+80°C) as follows: Remove plug from thermo-time switch and ground term. W.

Testing the start valve for leaks

1. When installed:

Pinch off the fuel delivery line at the start valve. If engine then runs smoothly, replace start valve.

2. When removed:

Remove the start valve (caution! fire hazard!). Fuel lines and electric leads remain connected (place collector vessel under the start valve). Build up the fuel pressure (remove control relay and fit jumper into connection base between term. 87b and term. 30).

Caution!

The jumper must be removed again after test is completed and the control relay must be fitted in position.

Test specification: Within one minute max. 1 drop may form at the mouth of the valve.

yes

Thermo-time switch O.K.?

no

Electrical test:

Test the thermo-time switch 35°C/8 sec. as follows: Remove the plug and measure resistance directly at thermo-time switch with ohmmeter.

yes

Are all hose lines and electric leads securely attached? visual examination.
Is the air-intake system leak-tight?

no

Check whether hoses of air-intake system and of fuel line system are securely attached, not kinked or damaged. If necessary, replace hoses. Eliminate leaks with new seals or by re-tightening the connecting screws.

Checking for leaks:

Seal off exhaust tail pipe. Screw off hose from air filter to air-flow sensor on air-flow sensor and seal off air-flow sensor duct. Pull off hose after auxiliary-air device and blow air (0.3 bar gauge pressure) into the intake manifold with a compressed-air gun. Seal off connection port on auxiliary-air device. Open throttle valve fully while doing this. Brush or spray all joints with soapy water. Bubbling or foaming indicates a leak.

Check electric contacts for loose connection.

Throttle valve closed?

no

Testing:

Throttle valve closed?

Check whether the throttle valve can be closed still further and whether the engine speed thereby drops.

Adjustment:

The throttle valve must be set to just before it sticks with the throttle-valve stop screw. Turn 1/4 to max. 1/2 turn in opposite direction.

Adjusting the throttle-valve switch:

Slightly loosen the throttle-valve switch fastening screws and turn the throttle-valve switch in an anti-clockwise direction until idle contact (microswitch) is heard to click.

Checking the adjustment:

Pull slightly on the throttle cable. The idle contact (microswitch) must be heard to click.

Start valve O.K.?

no

Functional test: Check the power supply to the start valve when starting. To do this, remove the plug from the start valve and connect voltmeter to term. 30 and term. 29/term. 4 of the start valve plug.

1. Coolant temperature at ambient temperature (+15°C...+30°C): voltage reading min. 6 V.

2. Coolant temperature at engine temp.(approx.+80°C) Voltage reading approx. 0 V.

Test the following leads for continuity using ohmmeter (set value approx. 0 Ω):

Lead from term. 30 to thermo-time switch term. W.

Lead from term. 29 to thermo-time switch term. G.

Lead from term. 4 to control relay term. 50. Check ground connection of thermo-time switch.

Electrical test of start valve:

Connect ohmmeter to start valve term. 29 and term. 30: set value approx. 4 Ω.

Mechanical test of start valve:

Remove start valve from intake manifold and hold in a container. (Caution! fire hazard!). When starting and at ambient temp.(+15°C...+30°C) the start valve must squirt (max. 8 secs.). At engine temp. (+80°C) the start valve must not squirt. With the ignition switched on and the pressure built up, the start valve must likewise not squirt.

yes

Start valve O.K.?
(continued)

no

Carry out squirt test at engine temperature (+80°C) as follows: Remove plug from thermo-time switch and ground term. W.

Testing the start valve for leaks

1. When installed:

Pinch off the fuel delivery line at the start valve. If engine then runs smoothly, replace start valve.

2. When removed:

Remove the start valve (caution! fire hazard!). Fuel lines and electric leads remain connected (place collector vessel under the start valve). Build up the fuel pressure (remove control relay and fit jumper into connection base between term. 87b and term. 30).

Caution!

The jumper must be removed again after test is completed and the control relay must be fitted in position.

Test specification: Within one minute max. 1 drop may form at the mouth of the valve.

yes

Thermo-time switch O.K.?

no

Electrical test:

Test the thermo-time switch 35°C/8 sec. as follows: Remove the plug and measure resistance directly at thermo-time switch with ohmmeter.

yes

Are all hose lines and electric leads securely attached?
Visual examination.
Is the air-intake system leak-tight?

no

Check whether hoses of air-intake system and of fuel line system are securely attached, not kinked or damaged. If necessary, replace hoses. Eliminate leaks with new seals or by re-tightening the connecting screws.

Checking for leaks:

Seal off exhaust tail pipe. Screw off hose from air filter to air-flow sensor on air-flow sensor and seal off air-flow sensor duct. Pull off hose after auxiliary-air device and blow air (0.3 bar gauge pressure) into the intake manifold with a compressed-air gun. Seal off connection port on auxiliary-air device. Open throttle valve fully while doing this. Brush or spray all joints with soapy water. Bubbling or foaming indicates a leak.

Check electric contacts for loose connection.

Fuel delivery O.K.?

no

Measuring the fuel delivery:

For testing, undo the junction between the fuel return hose (from pressure regulator) and fuel return line (to fuel tank). If necessary, extend hose and lead into a 5 l vessel with graduated scale.

Remove the control relay and fit a jumper into the connection base between term. 87b and term. 30. Fuel pump must operate.

Caution! Be sure to remove the jumper after you have finished testing.

Test specification: min. 700 cm³/30s

Remedy if test specification not reached:

- Fuel filter clogged → replace
- Voltage at fuel pump plugs, with engine running min. 12V → clean contacts; possibly also eliminate poor ground connection; replace leads.
- Fuel pressure regulator defective → replace
- Fuel pump delivery too low → replace fuel pump.

yes

Control unit O.K.?

no

Let engine run. Shake control unit lightly and move multiple plug. Watch for engine missing. Restore plug-in connection on multiple plug or replace defective control unit.

G11

Engine missing under all op. conditions
Opel Manta, Rekord 2.0 l

G12

Engine missing under all op. conditions
Opel Manta, Rekord 2.0 l

Engine missing under all operating conditions (continued)

Burbling on the overrun?
throttle valve closed? CO and
idle adjustment O.K.?

no

1. Check the exhaust system for leaks.
2. Throttle valve closed?
Check whether the throttle valve can be closed
still further and whether the engine speed thereby
drops.

Adjustment:

Throttle valve must be set to just before it
sticks with the throttle-valve stop screw.
Turn 1/4 to max. 1/2 turns in opposite direction.

Adjusting the throttle-valve switch:

Slightly loosen the throttle-valve switch fasten-
ing screws and turn the throttle-valve switch
in an anti-clockwise direction until idle contact
(microswitch) is heard to click.

Checking the adjustment:

Pull slightly on the throttle cable. The idle
contact (microswitch) must be heard to click.

If a vacuum limiter is installed (Sweden only):

Pinch off the connecting hose before or after the
vacuum limiter. Change in engine speed? If yes,
replace vacuum limiter.

yes

Continued on G15/G16

G 14

Engine missing under all op. conditions
Opel Manta, Rekord 2.0 l

Engine missing under all operating conditions (continued)

Burbling on the overrun?
throttle valve closed? CO and
idle adjustment O.K.?
(continued)

no

3. Testing the overrun cutoff:

Bring the engine to 3000 min^{-1} and, using insulated wire, bridge term. 2 and term. 9 in the plug of the throttle-valve switch.

Far below ambient temperature ($+15^{\circ}\text{C} \dots +30^{\circ}\text{C}$):

Up to approx. 2060 min^{-1} there must be no injection pulses. Below 2060 min^{-1} the injection pulses must be present again. The reinstatement speed is approx. 300 min^{-1} higher.

Warm engine temperature (approx. 80°C):

Up to approx. 1300 min^{-1} there must be no injection pulses. Below 1300 min^{-1} the injection pulses must be present again. The reinstatement speed is approx. 300 min^{-1} higher.

4. CO and idle adjustment

Exhaust-gas test with CO analyzer with engine at normal operating temperature and at idle speed.

Idle speed

Manually-shifted transmission: $850 \dots 900 \text{ min}^{-1}$

Automatic transmission

(Selector lever in position "P"):

$850 \dots 900 \text{ min}^{-1}$

CO setting:

max. 1.0% by vol. CO

Let warmed-up engine idle with the air conditioner (if fitted) switched off. Apply battery voltage to the solenoid-operated air valve. Engine speed is increased by approx. 150 min^{-1} . If there is no change in engine speed, replace the solenoid-operated air valve.

yes

Continued on G17/G18

G16

Engine missing under all op. conditions
Opel Manta, Rekord 2.0 l

Engine missing under all operating conditions (continued)

Burbling on the overrun?
throttle valve closed? CO and
idle adjustment O.K.?
(continued)

no

If CO concentration too high, turn bypass screw
(CO adjusting screw) in air-flow sensor half a
turn in a counterclockwise direction. Check
engine speed and CO concentration. Carry out
adjustments in several steps. After adjusting,
use new plugs.

yes

Solenoid-operated injection
valve mechanically O.K.

no

With the engine running, disconnect the injection
valve connectors individually, one after the other,
from the injection valves and plug on again.
Engine speed must drop if injection valve is O.K..
Using ohmmeter, test for continuity in the connect-
ing leads from control relay term. 87 to the
individual injection valves and from the injection
valves to the multiple plug term. 12. Set value
approx. 0Ω . Resistance of the individual
injection valves: $15.0..20.0 \Omega$. Caution! when
replacing the injection valves, install only
solenoid-operated injection valve 0 280 150 205
(yellow plug part).

yes

Trouble-shooting program according to customer complaints

How to use the following trouble-shooting program

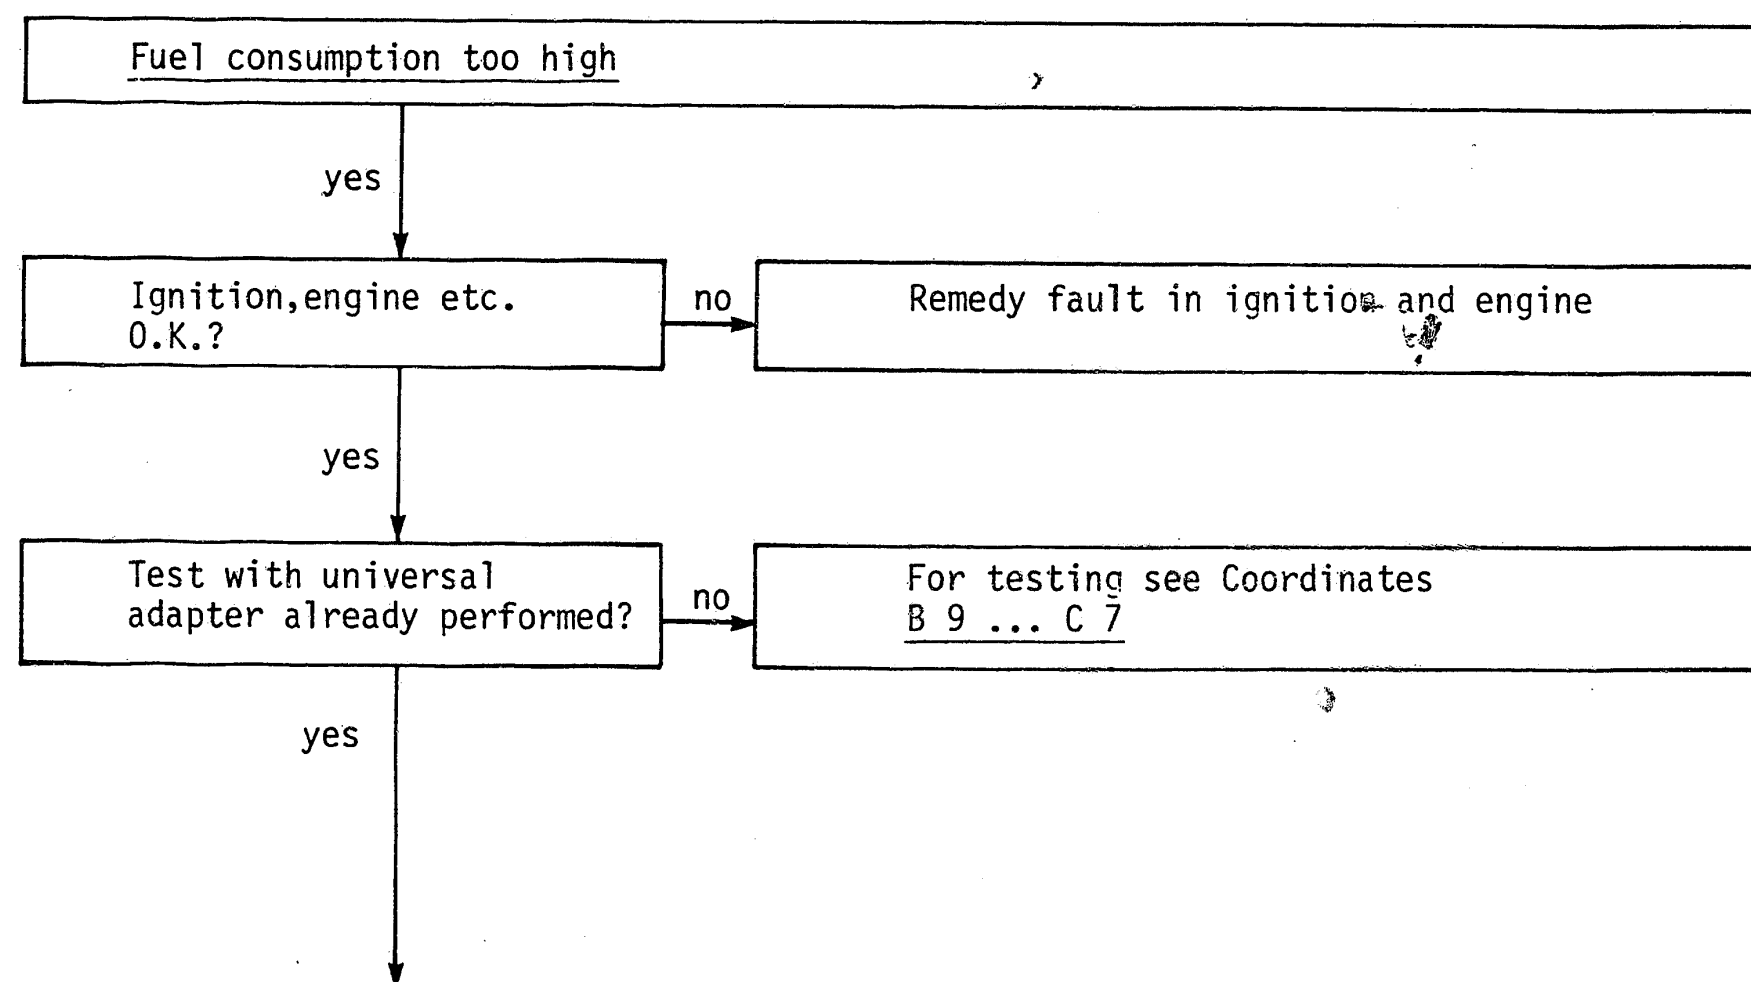

The program is divided into 3 rows of boxes:

1. The left-hand row contains the questions on the tests.
2. The middle row contains descriptions of the testing and adjustment operations on the components.
3. The right-hand row contains the illustrations belonging to the text and explains the illustrations.

If the questions can be answered conclusively with "yes" without testing, proceed to the next question below.

If, on the other hand, the answer to the question is "no", and you suspect a fault, branch to the middle row of boxes and carry out the tests given there.

When you have finished testing continue trouble-shooting at the point at which you branched off.

Are all hose lines and electric leads securely attached?
Visual examination.
Is the air-intake system leak-tight?

no

Check whether hoses of air-intake system and of fuel line system are securely attached, not kinked or damaged. If necessary, replace hoses. Eliminate leaks with new seals or by re-tightening the connecting screws.

Checking for leaks:

Seal off exhaust tail pipe. Screw off hose from air filter to air-flow sensor on air-flow sensor and seal off air-flow sensor duct. Pull off hose after auxiliary-air device and blow air (0.3 bar gauge pressure) into the intake manifold with a compressed-air gun. Seal off connection port on auxiliary-air device. Open throttle valve fully while doing this. Brush or spray all joints with soapy water. Bubbling or foaming indicates a leak.

Check electric contacts for loose connection.

no

Testing:

Open air-flow sensor flap by hand. It must be possible to open the air-flow sensor flap with uniform ease from its fully closed position to its fully open position. When released, the flap must close completely by itself. When the air-flow sensor flap is opened it must not catch at any point. Watch for any indications of abrasion or rubbing. Clean air-flow sensor if the inside is very dirty and rub out with a lint-free cloth. If there are any signs of abrasion or rubbing, replace the air-flow sensor.

Connect ohmmeter to term. 8 and term. 9 of air-flow sensor. Test specification: 160...300 Ω . Connect ohmmeter to term. 7 and term. 5 of air-flow sensor. Deflect air-flow sensor flap. Test specification: 60...1000 Ω . Sensor flap must return to rest position. If not, the stopper or the sensor flap is bent. Replace air-flow sensor.

yes

Fuel pressure O.K.?

Test specification:

Europe: 2.3...2.7 bar

Sweden: 2.8...3.2 bar

Test specification reached?

no

Testing the fuel pressure

Connect the connections of the pressure tester into the fuel delivery line. If using pressure tester KDJE-P 100, close the hollow screw when testing the LE-Jetronic.

Caution: When removing the fuel hose make sure that no fuel gets onto hot parts of the engine.

yes

Pressure regulator O.K.?

Test specification reached?

no

Remove the control relay. Fit a jumper into the connection base between term. 87b and term. 30.

Fuel pump must operate

Fuel pump pressure:

Europe: 2.3...2.7 bar

Sweden: 2.8...3.2 bar

Caution!

Remove the jumper and fit the control relay in position. Let the engine idle → fuel pump pressure approx. 2.0 bar or 2.5 bar.

Testing the pressure regulator

Remove the control relay and fit a jumper into the connection base between term. 87b and term. 30.

Electric fuel pump must operate.

Fuel pump pressure:

Europe: 2.3...2.7 bar

Sweden: 2.8...3.2 bar

Fuel pressure of 2.3 bar or 2.8 bar not reached:

1. Slowly pinch off fuel return line: (caution: do not load pressure gauge above 6 bar).

Pressure rises above 4 bar → replace pressure regulator.

Pressure remains below 4 bar → replace fuel pump.

yes

K2

CO adjustment

Opel Manta, Rekord 2.0 1

CO adjustment at idle too low or too high (continued)

CO concentration below tolerance?

max. 1.0 % by vol.

Temperature sensors O.K.?

no

Testing:

Temperature sensor I measures the intake air temperature and is located in the air duct of the air-flow sensor. Measure the following resistance value between term. 8 and term. 9 of the air-flow sensor: 160...300 Ω .

Using ohmmeter, make direct measurement at temperature sensor II (engine). Resistance measurement at term. 10 and term. 38 (ground):

Ambient temperature (+15°C..+30°C): 1.45..3.3 k Ω

Engine temperature (approx.+80°C): 280..360 Ω

If incorrect, check for open circuit or short circuit in following leads using ohmmeter:

Temperature sensor I:

Multiple plug term. 8 to air-flow sensor term. 8 and air-flow sensor term. 9 to multiple plug term. 9.

Temperature sensor II:

Multiple plug term. 10 to temperature sensor II term. 10 and temperature sensor II term. 38 to central ground (lead 38).

Check all contacts in the plug-in connections.

C0 adjustment at idle too low or too high (continued)

C0 concentration below tolerance?

max. 1.0 % by vol.

Start valve O.K.?

no

Testing the start valve for leaks:

1. When installed

Pinch off the fuel delivery line at the start valve. If engine then runs smoothly, replace start valve.

2. When removed

Remove the start valve (caution! fire hazard!). Fuel lines and electric leads remain connected (place collector vessel under the start valve). Build up the fuel pressure (remove control relay and fit jumper into connection base between term. 87b and term. 30).

Caution!

The jumper must be removed again after test is completed and the control relay must be fitted in position.

Test specification: Within one minute max. 1 drop may form at the mouth of the valve.

yes

New Product

L-JETRONIC, 2nd. GENERATION

28

VDT-I-280/5 En

8.1981

General

The familiar L-jetronic system has now been extended by the introduction of the 2nd. generation L-Jetronic. There are now 2 L-Jetronic systems on the market. This 2nd. generation system has been further developed in a number of the most important major components with the aim of reducing costs.

As regards functioning, the 2nd. generation L-jetronic differs insignificantly from its predecessor.

The following components and functions have been modified:

- Control unit
- Air-flow sensor
- Control relay
- Solenoid-operated fuel-injection valve
- Overrun cut-off (reduction in fuel consumption)

- 1 = 2nd. generation control unit
- 2 = Air-flow sensor
- 3 = Solenoid-operated fuel-injection valve
- 4 = Control relay

L1

Technical Bulletins

Opel Manta, Rekord 2.0 T

Control unit

The circuitry of the control unit has been simplified. The electronic functions, though, remain unchanged.

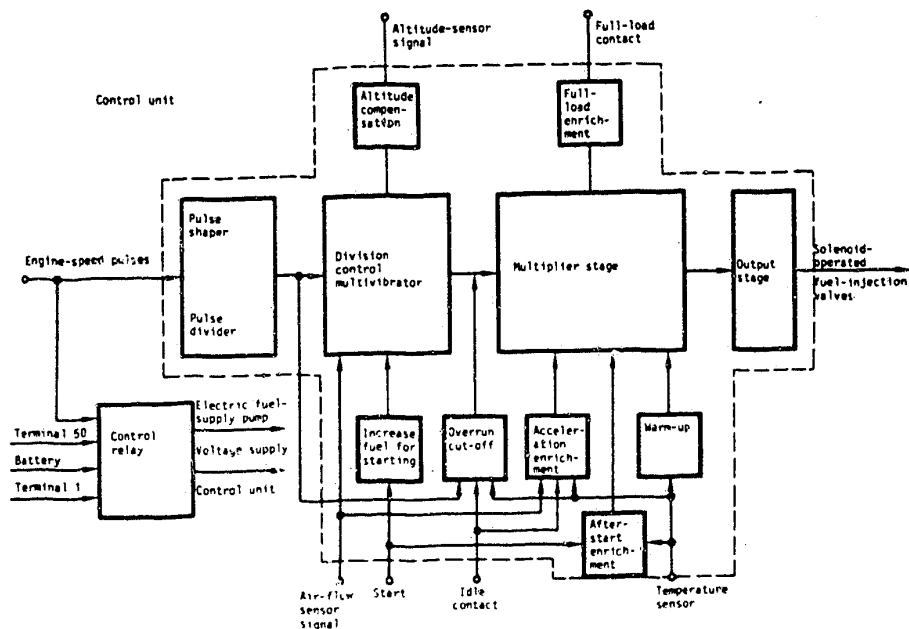

Due to the simplification measures, the circuitry is considerably more compact and this means that the casing can be slightly reduced in size and is lighter. The connection plug was also reduced to a 25-pin version.

Depending upon customer requirements, auxiliary and/or corrective functions can be incorporated in the control unit in order to adapt fully to the particular characteristics of the engine concerned.

Available functions:

- Basic control
- Overrun cut-off
- Increased fuel for starting
- Altitude compensation (input circuitry)
- After-start fuel enrichment
- Acceleration enrichment
- Full-load enrichment
- Warm-up

2nd generation L-Jetronic (block diagram)

Air-flow sensor:

The air-flow sensor has retained its shape and was only modified in the potentiometer chamber.

The pump contact has been omitted, and the air-temperature sensor (NTC 1) is now integrated within the circuitry of the air-flow sensor.

Due to these modifications, the number of terminal points was reduced from 7 to 5 (one of these terminals is the measurement point M, or E, and is reserved exclusively for alignment and calibration at the works).

Control relay:

Due to the fact that the pump contact has now been omitted from the air-flow sensor, the fuel-flooding safeguard function had to be transferred to another component. A control relay (rotational-speed relay) takes over this, as well as a number of other functions. During starting, voltage is supplied to the solenoid-operated injection valves and the electric fuel-supply pump through terminal 50 of the control unit.

When the engine has started, voltage continues to be applied only if the engine speed remains above 225 min^{-1} for 4-cylinder engines and 150 min^{-1} for 6-cylinder engines.

The relay set has been replaced by this control relay.

Solenoid-operated injection valves (yellow plug):

The control unit has a switched final stage. For this reason, the solenoid-operated injection valves are fitted with a brass solenoid winding.

Due to the former series resistors now being omitted, resistance had to be transferred to the injection valves themselves. This led to the development of a brass solenoid winding in place of the one made of copper (brass has a higher specific resistance than copper).

LE-Jetronic

Vehicles manufactured as from 9.81

With the above mentioned types of vehicle Opel are introducing the L-Jetronic of the 2nd. generation.
The difference from the existing L-Jetronic systems is not the method of operation of the injection system, but the design of the control unit and of the injection valves.

Control unit (0 280 000 3..)

- new electronic construction
- new plug and socket, 25 pin
- new housing

Injection valves (0 280 150 2..)

- brass-wire coil with higher resistance

Testing possibility L-Jetronic II

From February 1982 a Universal tester will be available to the After-Sales Service Organization. The L-Jetronic II and other new injection systems can be tested with this tester.

Urgent cases for the After-Sales Service

If problems should arise on vehicles with L-Jetronic II during the period prior to the availability of the Universal tester, please contact KH/VKD 2.

CAR ALARM II - 0 335 411 901

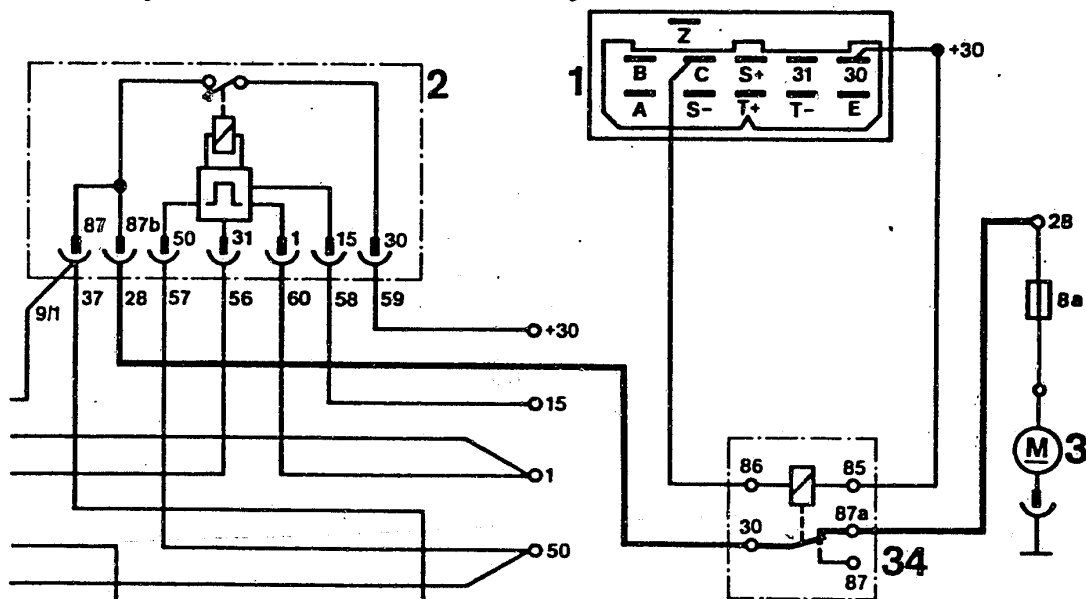

in vehicles with LE-Jetronic

VDT-I-335/111.En

11.1981

If Car Alarm II (0 335 411 901) is fitted at a later stage in vehicles in which the engines are equipped with L-Jetronic of the 2nd. generation, then we recommend using the following wiring circuit as protection against theft. In this way the fuel pump is switched off when the alarm system is "primed." No fuel is therefore supplied.

DETERMINATION OF THE TEMPERATURE VALUES
GIVEN IN L-JETRONIC MANUALS

VDT-I-280/108 En
5.1982

We have recently been asked with increasing regularity how accurately the engine temperature must be measured when trouble-shooting on the vehicle.

So far in its L-Jetronic manuals KH/VSK has given three or four different temperatures for testing the temperature sensor:

-10 °C, +20 °C, +40 °C and +80 °C,

and two ranges for the thermo-time switch e.g. 35 °C 8 sec.

below +30 °C and above +40 °C.

Since the temperature range need not be subject to such close tolerances, we propose in future the following more appropriate definition:

- Ambient temperature (approx. +15 °C to +30 °C);
- Engine at normal operating temperature (approx. +80 °C).

CODING OF LE/LH-JETRONIC
SOLENOID-OPERATED INJECTION VALVES

VDT-I-280/109 En
5.1982

With the introduction of the LE/LH-Jetronic the internal resistance of the solenoid-operated injection valves has also been changed.

The connector has been left the same for cost reasons and to meet customer wishes.

Caution!

If L-Jetronic injection valves are installed in an LE/LH-Jetronic vehicle, either the control unit or the injection valves will suffer irreparable damage.

Note:

- Install only injection valves with the part number designated for the vehicle.
- As a guide, injection valves with 16.2 Ω internal resistance have a yellow protective sleeve.

- A colour coding (yellow) of the connector (see also VDT-I-280/5) is not generally intended for LE/LH-Jetronic injection valves.

Please direct questions and comments concerning the contents to our authorized representative in your country.
